• Approach: To take a deterministic view (Avestimehr-Diggavi-Tse 2007)

• Goal: A systematic approach to identify approximately optimal choice of input/auxiliary random variables

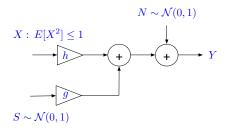

- Approach: To take a deterministic view (Avestimehr-Diggavi-Tse 2007)
- Plan:
 - Revisit Costa's dirty-paper channel

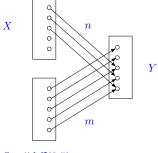

- Goal: A systematic approach to identify approximately optimal choice of input/auxiliary random variables
- Approach: To take a deterministic view (Avestimehr-Diggavi-Tse 2007)
- Plan:
 - Revisit Costa's dirty-paper channel
 - Apply the insight to the problems of: 1) secret writing on dirty paper; and 2) two-user symmetric Gaussian interference channel

Writing on dirty paper

Gaussian model

ADT linear deterministic model

 $S \sim \text{iid} \mathcal{B}(0.5)$

Y = hX + gS + N

 $Y = D_q^{q-n}X + D_q^{q-m}S$

・ロト ・ 語 ト ・ 語 ト ・ 語 ・ ・ 日 ・ 今 今 ?

Capacity of deterministic model

- *Y* is a deterministic function of (*X*, *S*):
 - Simplifying the upper bound:

$$C \leq \max_{p(x|s)} I(X;Y|S)$$

=
$$\max_{p(x|s)} H(Y|S) - H(Y|X,S)$$

=
$$\max_{Y} H(Y|S)$$

Capacity of deterministic model

- *Y* is a deterministic function of (*X*, *S*):
 - Simplifying the upper bound:

$$C \leq \max_{p(x|s)} I(X;Y|S)$$

=
$$\max_{p(x|s)} H(Y|S) - H(Y|X,S)$$

=
$$\max_{p(x|s)} H(Y|S)$$

• Choosing U = Y:

$$C \geq \max_{p(x|s)} I(Y;Y) - I(Y;S)$$
$$= \max_{p(x|s)} H(Y) - I(Y;S)$$

$$= \max_{p(x|s)} H(Y|S)$$

Capacity of deterministic model

- *Y* is a deterministic function of (*X*, *S*):
 - Simplifying the upper bound:

$$C \leq \max_{p(x|s)} I(X;Y|S)$$

=
$$\max_{p(x|s)} H(Y|S) - H(Y|X,S)$$

=
$$\max_{p(x|s)} H(Y|S)$$

• Choosing U = Y:

$$C \geq \max_{p(x|s)} I(Y;Y) - I(Y;S)$$

=
$$\max_{p(x|s)} H(Y) - I(Y;S)$$

=
$$\max_{p(x|s)} H(Y|S)$$

Conclusion:

$$C = \max_{p(x|s)} H(Y|S)$$

Capacity of ADT linear deterministic model

• For ADT linear deterministic model:

$$H(Y|S) = H(D_q^{q-n}X + D_q^{q-m}S|S)$$

$$\leq H(D_q^{q-n}X)$$

$$\leq \operatorname{rank}(D_q^{q-n})$$

$$= n$$

where equality holds when X is Bernoulli-1/2 and independent of S

• ADT linear deterministic model (an optimal choice):

$$U = Y = D_q^{q-n}X + D_q^{q-m}S$$

where X is i.i.d. Bernoulli-1/2 and independent of S

• ADT linear deterministic model (an optimal choice):

$$U = Y = D_q^{q-n}X + D_q^{q-m}S$$

where X is i.i.d. Bernoulli-1/2 and independent of S

• Connections between Gaussian and ADT linear deterministic models:

 $h \Leftrightarrow D_q^{q-n}$ and $g \Leftrightarrow D_q^{q-m}$

• ADT linear deterministic model (an optimal choice):

$$U = Y = D_q^{q-n}X + D_q^{q-m}S$$

where X is i.i.d. Bernoulli-1/2 and independent of S

• Connections between Gaussian and ADT linear deterministic models:

 $h \Leftrightarrow D_q^{q-n}$ and $g \Leftrightarrow D_q^{q-m}$

• Gaussian model (suggested by the ADT linear deterministic model):

$$U = hX + gS$$

where X is standard Gaussian and independent of S

• ADT linear deterministic model (an optimal choice):

 $U = Y = D_q^{q-n}X + D_q^{q-m}S$

where X is i.i.d. Bernoulli-1/2 and independent of ${\cal S}$

• Connections between Gaussian and ADT linear deterministic models:

 $h \Leftrightarrow D_q^{q-n}$ and $g \Leftrightarrow D_q^{q-m}$

• Gaussian model (suggested by the ADT linear deterministic model):

U = hX + gS

where \boldsymbol{X} is standard Gaussian and independent of \boldsymbol{S}

How good is this choice of (U, X)?

• U = hX + gS (suggested by the ADT linear deterministic model):

$$I(U;Y) - I(U;S) \ge \frac{1}{2}\log(h^2)$$

<ロト < @ ト < 注 ト < 注 ト 注 の < @</p>

• U = hX + gS (suggested by the ADT linear deterministic model):

$$I(U;Y) - I(U;S) \ge \frac{1}{2}\log(h^2)$$

• $U = hX + \frac{h^2}{h^2 + 1}gS$ (the optimal choice, Costa 1983): $I(U;Y) - I(U;S) = \frac{1}{2}\log(1+h^2)$

• U = hX + gS (suggested by the ADT linear deterministic model):

$$I(U;Y) - I(U;S) \ge \frac{1}{2}\log(h^2)$$

• $U = hX + \frac{h^2}{h^2 + 1}gS$ (the optimal choice, Costa 1983): $I(U;Y) - I(U;S) = \frac{1}{2}\log(1+h^2)$

• Capacity to within 1/2 bit

• U = hX + gS (suggested by the ADT linear deterministic model):

$$I(U;Y) - I(U;S) \ge \frac{1}{2}\log(h^2)$$

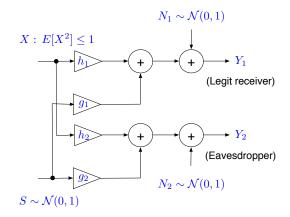

• $U = hX + \frac{h^2}{h^2+1}gS$ (the optimal choice, Costa 1983):

$$I(U;Y) - I(U;S) = \frac{1}{2}\log(1+h^2)$$

• Capacity to within 1/2 bit

How robust is this approach?

Secret writing on dirty paper

- Sⁿ: Non-causally known at the transmitter as side information
- Secrecy constraint: $(1/t)I(M; Y_2^t) \rightarrow 0$

• A single-letter achievable secrecy rate (Chen-Vinck 2008):

$$C_s \ge \max_{p(u,x|s)} \min[I(U;Y_1) - I(U;S), I(U;Y_1) - I(U;Y_2)]$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ □ □ のへで

Achieved by a double binning scheme

• A single-letter achievable secrecy rate (Chen-Vinck 2008):

$$C_s \ge \max_{p(u,x|s)} \min[I(U;Y_1) - I(U;S), I(U;Y_1) - I(U;Y_2)]$$

- Achieved by a double binning scheme
- A simple upper bound:

$$C_s \le \max_{p(x|s)} \min[I(X; Y_1|S), I(X, S; Y_1|Y_2)]$$

• A single-letter achievable secrecy rate (Chen-Vinck 2008):

 $C_s \ge \max_{p(u,x|s)} \min[I(U;Y_1) - I(U;S), I(U;Y_1) - I(U;Y_2)]$

- Achieved by a double binning scheme
- A simple upper bound:

$$C_s \le \max_{p(x|s)} \min[I(X;Y_1|S), I(X,S;Y_1|Y_2)]$$

(日) (日) (日) (日) (日) (日) (日) (日)

• No obvious choice of (U, X) to match the simple upper bound

• A single-letter achievable secrecy rate (Chen-Vinck 2008):

Sum capacity of ADT linear deterministic model

Sum capacity of ADT linear deterministic model

Can the simple strategy of treating interference as noise be good beyond the "very-weak" interference regime?

(日)、<部)、<注()、<注()、<注()、</p>

The limit of treating interference as noise

• Treating interference as noise can be arbitrarily good:

$$C_{sum} = \lim_{k \to \infty} \frac{C_{sum}^{(k)}}{k}$$

where

$$C_{sum}^{(k)} := \max_{p(x_1^k)p(x_2^k)} \left[I(X_1^k;Y_1^k) + I(X_2^k;Y_2^k) \right]$$

◆□▶ ◆□▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ● ● ● ● ●

The limit of treating interference as noise

• Treating interference as noise can be arbitrarily good:

$$C_{sum} = \lim_{k \to \infty} \frac{C_{sum}^{(k)}}{k}$$

where

$$C^{(k)}_{sum} := \max_{p(x_1^k)p(x_2^k)} \left[I(X_1^k;Y_1^k) + I(X_2^k;Y_2^k) \right]$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへぐ

• Caveats: Multi-letter and/or non-Gaussian codebooks might be needed to approach the sum capacity

The limit of treating interference as noise

- ▶ $(1, I_q)$ is sufficient for the "very-weak" interference regime
- What about the other regimes?

•
$$\alpha = m/n \ge 2$$
 so $m \ge n$ and $q = \max(m, n) = m$

◆□▶ ◆□▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ● ● ● ● ●

- $\alpha = m/n \ge 2$ so $m \ge n$ and $q = \max(m, n) = m$
- Consider k = 1 and

$$E = \left[\begin{array}{c} I_n \\ 0_{(m-n) \times n} \end{array} \right]$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ □ □ のへぐ

•
$$\alpha = m/n \ge 2$$
 so $m \ge n$ and $q = \max(m, n) = m$

• Consider k = 1 and

$$E = \left[\begin{array}{c} I_n \\ 0_{(m-n) \times n} \end{array} \right]$$

• We have
$$BE = E$$
 and

$$[AE BE] = \begin{bmatrix} 0_{n \times n} & I_n \\ 0_{(m-2n) \times n} & 0_{(m-2n) \times n} \\ I_n & 0_{n \times n} \end{bmatrix}$$

< □ > < □ > < 臣 > < 臣 > < 臣 > ○ < ♡ < ♡

•
$$\alpha = m/n \ge 2$$
 so $m \ge n$ and $q = \max(m, n) = m$

$$E = \left[\begin{array}{c} I_n \\ 0_{(m-n) \times n} \end{array} \right]$$

$$[AE BE] = \begin{bmatrix} 0_{n \times n} & I_n \\ 0_{(m-2n) \times n} & 0_{(m-2n) \times n} \\ I_n & 0_{n \times n} \end{bmatrix}$$

• Clearly,

$$rank([AE BE]) - rank(BE) = 2n - n = n = \frac{C_{sum}}{2}$$

< □ > < □ > < 臣 > < 臣 > < 臣 > ○ < ♡ < ♡

The other regimes

• Block designs for *E* are sufficient!

▲ロト ▲園 ▶ ▲ 臣 ▶ ▲ 臣 ● りへぐ

The other regimes

• Block designs for *E* are sufficient!

< □ > < □ > < 臣 > < 臣 > < 臣 > ○ < ♡ < ♡

• May require k up to 2

• The "very-weak" interference regime:

$$E = I_n \implies \text{Gaussian}$$

• The "very-weak" interference regime:

$$E = I_n \implies \text{Gaussian}$$

• The "very-strong" interference regime:

$$E = \left[\begin{array}{c} I_n \\ 0_{(m-n) \times n} \end{array} \right] \quad \Longrightarrow \quad \text{Discrete}$$

• The "very-weak" interference regime:

$$E = I_n \implies Gaussian$$

• The "very-strong" interference regime:

$$E = \left[\begin{array}{c} I_n \\ 0_{(m-n) \times n} \end{array} \right] \quad \Longrightarrow \quad \text{Discrete}$$

• The other regimes: Mixture Gaussian (convolution between Gaussian and discrete)

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへぐ

• The "very-weak" interference regime:

$$E = I_n \implies Gaussian$$

• The "very-strong" interference regime:

$$E = \left[\begin{array}{c} I_n \\ 0_{(m-n) \times n} \end{array} \right] \quad \Longrightarrow \quad \text{Discrete}$$

- The other regimes: Mixture Gaussian (convolution between Gaussian and discrete)
- Sum capacity within $\log \log \max(|h|^2, |g|^2)$ bits (preliminary analysis)

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶

Summary

• Identifying an optimal choice of input/auxiliary random variables in a single/multi-letter capacity/achievable rate expression for Gaussian networks can be extremely challenging

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ </p>

- We look for a more systematic search guided by the ADT linear deterministic model:
 - May settle for approximate optimality
- A more refined deterministic model (than the ADT linear deterministic model) might be needed to achieve universal approximation
